SX.e Scanning ReadMe List

The sxe-10x-scanning folder includes this readme.txt file and 2 folders.

The sample-jobdefs folder includes sample job definition(s) that can be used to help a user / integrator set up appropriate definitions for automating the process of indexing and uploading scanned or imported documents into the UnForm archives. The job definition(s) were originally developed to work with archiving demonstrations on SDSI systems and are not being represented as meeting all the needs of particular SX.e users. Infor/SX.e development or product managers have not been involved in determining any requirements for suitability, and the staffs of UnForm resellers or the technical staffs of SX.e end users should plan on using and testing the job definition(s) and the results they produce before deploying them in a live archiving environment. Individual needs of UnForm users can vary widely, and it is expected that there be a discovery phase prior to deployment to precede the configuration and possible customization of job definitions, just as is the practice with UnForm rule files.

SDSI provides professional services and assistance to resellers and end users with various levels of fee-based or no-charge support depending on particular needs and circumstances.

The sample-scandocs folder may include some sample document(s) that are designed to be used to test the job definitions in the field.
